Revolutionary B12 Skin Care Catered to Your Age

(September 10, 2019 - U.S.A.) What if skincare was formulated with ingredients that align with how your body ages? You've heard all the hype about advances in stem cell research and the benefits of vitamins, plant extracts, juicing, and more. How would incorporating these ingredients into your skincare products help your skin over time? It's time to join the Slow Beauty Revolution.

SimySkin™ knows the answer to this question. SimySkin™ has produced a new skincare line, and its products, which are formulated and manufactured in France, are designed to work directly with what the human body experiences at various stages in life. SimySkin developed its product line in priority serums that would be efficient and novel enough to enter the mid-priced market, allowing prevention, maintenance, and repair for skin of all ages. This personalized approach to skincare sets SimySkin™ apart from the crowd. SimySkin™ has been featured in Vogue magazine and shows such as The View, CityLine, Breakfast Television, The Marilyn Denis Show.

Developed through a long-term partnership between founder Georges Benarroch and Dr. Uri Sagman, the company at the origin of SimySkin™ obtained a number of patents related to Vit B12, which is the main ingredient to the varying formulas that deliver high-quality, clinically-effective anti-aging products. Four stages of aging are represented in its products: 25+, 35+, 45+, and 65+. When viewing the formulations, it is key for customers to pay attention to the *chrono-age* of their skin, the system that SimySkin uses to define the aging process. Chrono-aging is defined as the progressive weakening in the skin renewal process over time, leading to the worsening of the dermis, hypodermis, and support structures.

The unique formulations relate to skin requirements at a specific age and are the result of understanding the cumulative effects of ultraviolet radiation and pollution exposure over time, stress, and the process of epidermis renewal, which slows as one ages. Targeted skincare features include a focus on reducing inflammation, minimizing crow's feet, restoring skin elasticity, as well as many other common complaints about aging.

Overall, the results seen in the clinical trials show that regular use of the age-phased serums and essentials have helped firm, lift, and replenish to create healthy, radiant skin.

Rooted in biotechnology research, SimySkin™ evolved from more than a decade of study into the therapeutic effects of Vitamin B12, the signature ingredient in the SimySkin™ serums, which occurs naturally in the human body and is critical to human vitality.

When asked what ingredients he was most excited about in the serums, Benarroch answered, "We are excited about ingredients such as hibiscus, galactic acid, essenkin, seaweed extract, and globe daisy extract. Hibiscus extract is one of the most powerful anti-aging plants in the world. It is rich in antioxidants, increases skin elasticity, and offers a stunning boost to the skin."

SimySkin™ serums are 90 percent natural and effective, and the company has shown clinically-proven results for each of its targeted chrono-ages.

The mission of SimySkin™ is clear: to produce age-specific serums to reduce the effects of time, environment, and stress on the skin.

"No individual or ethnicity is immune to the aging process. I believe that genetics (which you cannot control) and lifestyle, diet, and exercise (which you may control) have a great influence on one's skin," Benarroch said.
